

# Dragonfly

Dragonflies are capable of flying at speeds of more than 35 miles per hour (approximately 56 km/h), making them some of the fastest insects in the world. Their wings are specially adapted to produce a high degree of lift, which allows them to take off from and land on vertical surfaces. Dragonflies are found on every continent except Antarctica.

- 
1. How fast can dragonflies fly?
  2. What is the source of their lift?
  3. Where in the world are dragonflies found?
  4. Are dragonflies some of the fastest insects in the world? Explain
